QUALITY CONTROL

CONFORMITY TO THE BEST QUALITY STANDARDS

We think that **Product customization** is one of the best tools to understand what our customers want. **Every Customer is unique** with their set of demands or needs and identifying these uniquenesses is our goal. This awareness has led Cofermetal to invest in ever-increasing resources in the **innovation** of production processes and in the continuous research of new base material sources. The assembly procedures for all items are established and coded, with the **traceability** of the components and the timescale in which the materials will be prepared. This stage is a significant part of the ongoing monitoring of the work in progress.

From the project concept to the engineering, the **Know-how** and the competence in all project development phases, our team has the expertise required to analyse, face and solve the **complexities** of the various project phases, and to finalize even the most challenging product solutions. This results into a series of activities to source materials, to study the **sizing of the product** from a structural and electrotechnical point of view and then developing and producing complex construction drawings using 2D and 3D Software systems and finalize making prototypes. **We believe into Customization added to Quality**: this is our mission today.
